A42386
hsp 90-binding protein p59 - rabbit
C;Species: Oryctolagus cuniculus (domestic rabbit)
C;Date: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 10-Sep-1999
C;Accession: A42386

                                                                                                                                                                                                                                                                FUNCTION: Prevents misfolding and promotes the refolding and proper assembly of unfolded polypeptides generated under stress conditions (By similarity).

SUBJUNIT: Oligomer of 14 subunits composed of two stacked rings of SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

SIMILARITY: Belongs to the chaperonin (HSP60) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   VAVSADPIHYDKITEEINKAIDDAI-AAIEQSETIDPMKVPDHADKFERHVGIVDFKGEL

MEDLINE=MEDFS component of steroid receptor complexes binds to immobilized FKS106 and shows homology to FKBP-12 and FKBP-13.";
MEDLI Chem. 267:2868-2871(1992).

-I-FUNCTION: Component of unactivated mammalian steroid receptor complexes that sediment at 8-10 S. May have a rotamase activity.
MAY play a role in the intracellular trafficking of heteroilgomeric forms of steroid homone receptors.

-I-CAPALYTIC ACTIVITY: Peptidylproline (omega=180) = peptidylproline
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SUBUNIT: Interacts with NR3C1 and dynein (By similarity).
Associates with HSP90 and HSP70 in unactivated steroid hormone receptor complexes. Also interacts with peroxisomal phytanoyl-CoA alpha-hydroxylase (PHYH).
SUBCELJULAR LOCATION: Nuclear and cytoplasmic.
TISSUE SPECIFICITY: Widely expressed.
FTM: Phosphorylation by CK2 results in loss of HSP90 binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MEDLINE=92285692; PubMed=1376003;

science 296:2376-2379(2002).
-!- FUNCTION: Decarboxylation of S-adenosylmethionine provides the aminopropyl molety required for spermidine biosynthesis from putrescine (By similarity).
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine = (5-deoxy-5-adenosyl) (3-aminopropyl) methylsulfonium salt + CO(2).
-!- COFACTOR: Pyruvoyl graph (By similarity).
-!- COFACTOR: Pyruvoyl graph (By similarity).
-!- SIMILARITY: Belongs to the prokaryotic AdoMetDC family. Subfamily
                                                                                                                                                                                                                                                                                                    3 KFLLIAAVAFVAVSADPIHYDKITEEINKAIDDA----IAAIEQSE---TIDPMKVPDHA

"Genome sequence of a serotype M3 strain of group A Streptococcus:
phage-encoded toxins, the high-virulence phenotype, and clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Genome Res. 13:1042-1055 (2003).
-!- FUNCTION: GTPASE of unknown physiological role.
-!- SIMILARITY: Belongs to the era/trmE family of GTP-binding proteins. EngA subfamily.
                                                                                                                                                                                             emergence.";

phosphoprotein.";
Proc. Natl. Acad. Sci. U.S.A. 90:6839-6843(1993).
Proc. Natl. Acad. Sci. U.S.A. 90:6839-6843(1993).
-!- FUNCTION: Component of unactivated mammalian steroid receptor complexes that sediment at 8-10 S. May have a rotamase activity. May play a role in the intracellular trafficking of hetero-oligomeric forms of steroid hormone receptors.
-!- CATALYTIC ACTIVITY: Peptidylproline (omega=180) = peptidylproline
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       --DPMKVPDHAD-KFERHV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TPR 1.

MK -> HE (IN REF. 3).
TRGEGYAR -> LGVKAMQG (IN REF. 3).
                                                                                                       hormone receptor complexes. Also interacts with peroxisomal phytanoyl-CoA alpha-hydroxylase (PHYH). Interacts with NR3C1 and dynein (By similarity).

-!- SUBCELLULAR LOCATION Nuclear and cytoplasmic.
-!- PTW: Phosphorylation by CK2 results in loss of HSP90 binding activity (By similarity).
-!- SIMILARITY: Belongs to the FKBP-type PPIase family.
-!- SIMILARITY: Contains 2 FKBP-type PPIase domains.
-!- SIMILARITY: Contains 3 TPR repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Biol. Evol. 19:1162-1170(2002).

1-FUNCTION: Prevents misfolding and promotes the refolding and proper assembly of unfolded polypeptides generated under stress conditions (By similarity).

1-SUBUNIT: Oligomer of 14 subunits composed of two stacked rings of 7 subunits (By similarity).

1-SUBUNIT: Blongs to the chaperonin (HSP60) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    13 VAVSADPIHYDKITEEINKAIDDA-IAAIEQSETIDPMKVPDHADKFERHVGIVDFKGEL

Pares Wolution of the heat-shock protein GroEn from Buchnera, the primary endosymbiont of aphida, is governed by positive selection.";
Mol. Biol. Bvol. 19:1162-1170(2002).
-! FUNCTION: Prevents misfolding and promotes the refolding and proper assembly of unfolded polypeptides generated under stress conditions (By similarity).
-! SUBDNIT: Oligomer of 14 subunits composed of two stacked rings of 7 subunits (By similarity).
-! SUBCELDUAR LOCATION: Cytoplasmic (By similarity).
-! SINILARITY: Belongs to the chaperonin (HSP60) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

"Phylogenetical relationship based on groE genes among phenotypically
related Enterobacter, Pantoea, Klebsiella, Serratia, and Erwinia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                J. Gen. Appl. Microbiol. 43:355-361(1997).

-!- FUNCTION: Prevents misfolding and promotes the refolding and proper assembly of unfolding polypeptides generated under stress conditions (By similarity).

-!- SUBDNIT: Oligomer of 14 subunits composed of two stacked rings of x subunits (By similarity).

-!- SUBCRILULAR LOCATION: Cytoplesmic (By similarity).

-!- SIMILARITY: Belongs to the chaperonin (HSP60) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bacteria, Proteobacteria, Gammaproteobacteria, Enterobacteriales,

-!- SUBDNIT: Oligomer of 14 subunits composed of two stacked rings of 7 subunits (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: Belongs to the chaperonin (HSP60) family.

    John Microbiol. 43:355-361(1997).
    Gen. Appl. Microbiol. 43:355-361(1997).
    FUNCTION: Prevents misfolding and promotes the refolding and proper assembly of unfolded polypeptides generated under stress conditions (By similarity).
    SUBUNIT: Oligomer of 14 subunits composed of two stacked rings of 7 subunits (By similarity).
    Subunits (By similarity).
    SUBGELUIAR LOCATION: Cytoplemic (By similarity).
    SIMILARITY: Belongs to the chaperonin (HSP60) family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "Phylogenetical relationship based on groE genes among phenotypically related Enterobacter, Pantoea, Klebsiella, Serratia, and Erwinia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bacteria; Proteobacteria; Gammaproteobacteria; Enterobacteriales;

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the ENEL outstation-the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch). THE ACH CLASS OF RNA POLYMERASE IS ASSEMBLED FROM TEN TO TWELVE DIFFERENT POLYPEPTIDES. THE 215 KDA POLYPEPTIDE IS THE LARGEST COMPONENT OF RNA POLYPERASE II.

PURSELLULIAR LOCATION: Nuclear.

PTM: The tandem 7 residues repeats can be highly phosphorylated. The phosphorylation activates FOLZ.

The phosphorylation activates FOLZ.

The distinct zinc-containing RNA polymerases were found in eukaryotic nuclei: polymerase I for the ribosomal RNA precursor, polymerase II for the mRNA precursor, and polymerase III for SA and tRNA genes.

SIMILARITY: Belongs to the RNA polymerase beta' chain family. SEQUENCE OF 1-27 FROM N.A.
